

PMOD Software Release Notes

Version 4.0

Product Release 4.0

In addition to the individual improvements detailed two major areas are further developed in the new version.

1. While highly flexible and with unique functionality, the VOI user interface had reached a overwhelming complexity. Therefore, in version 4.0, the interface has been reorganized in a new "Compact" layout. It covers less space and provides better functional grouping. As we are confident that it will make VOI analysis easier and more efficient, it is the new default layout. However, the previous layout is still available for users who prefer continuing their proven workflows.
2. The PSEG tool has been extended by a new workflow intended for users with a need to assess hot lesions in static PET images. It includes the PERCIST methodology for objectively outlining and documenting the uptake in oncologic whole-body scans, but offers additional features: The lesion outlining result can be combined with texture analysis, and can directly be converted into training data sets for machine learning.

General	<ul style="list-style-type: none"> » Global Oncology setting supports specification of default SUV variant. » SUV display units: Warning symbol next to colorbar if required information is not complete. » Fusion balance can be shifted by mouse wheel while holding down the "F" key. » Image information dialog window: Slice times and species editor added. » DICOM anonymization added to file format conversion. » Direct starting of DICOM loader after creation of DICOMDIR file supported. » Restart possible after global configuration change; starting possible at the end of installation wizard. » DB extended query revised: image filter added; only patients/series are listed which contain elements corresponding to the applied filter. » Rebinning of dynamic series. Down-sampling: The area under the curve in each pixel is maintained. Up-sampling: Uses spline interpolation between frame mid-times. » Time domain filter: Despiking with 9 samples median absolute deviation method (MAD9) added. » Partial Volume Correction external tool: GTM speed improvement by multithread calculation; PVC (Brain MR based) extended by white matter correction. » Pipeline: Improved names of aggregates generated pipeline lists; tool added to calculate similarity measures relative to a mask; Option to scan a directory tree to build the list of input files. » Active model segmentation: Extended by median filter size and myocardial width restriction; parameter optimization by specification of target mask. » Segmentation: restriction by template VOIs supported. » Incoming folder functionality can use script alternative to pipeline. » Noise addition external tool extended: Poisson and uniform distributions added; definition of noise amplitude; amplitude and stdv based on reference VOI; conditional based on pixel value (<, >, ==). » Texture analysis of dynamic data results in dynamic texture measures.
----------------	---

	<ul style="list-style-type: none"> » Scaling external tool: *IMG option added to scale pixelwise by an image. » Handling of NaN values in image interpolation improved.
VOI	<ul style="list-style-type: none"> » New layout of the VOI user interface layout, called "Compact". » Statistics calculation: Results are displayed in display units (e.g. SUV); configuration list for defining the statistics of interest; time-consuming statistics moved from statistics menu to configuration list; indication of time-consuming elements in the list; default statistics menu entry; calculation speed improvements. » Iso-Contouring tool: Fundamentally revised; Average percentage threshold option added. » VOI naming using lists now also works on group level. A <number> at the end of the VOI name is used for generating label maps in PSEG. » New "Neutral" mode for selecting VOIs directly by clicking at them in the image or in the MIP. Single clicking into the VOIs list does not switch to contour definition plane, only double-clicking does. » <Ctrl+B> adds a prefix "{UNCLEAR}" to the name of the selected VOI. » "Peak" sphere volume can be defined for human, rat, mouse. » Speed improvement of VOI overlay display. » Properties dialog window reorganized; new property for locking contours. » Column in the VOI list indicating its role in tracking (seed etc) restricted to PGEM.
PSEG	<ul style="list-style-type: none"> » Completely new (PERCIST) workflow for static oncologic PET scans introduced, see documentation. » Texture analysis: measures based on run-length added.
PNEURO	<ul style="list-style-type: none"> » Rhesus macaque brain atlas added (INIA19, https://www.nitrc.org/projects/inia19/). » Handling of orientations (human/small animal) is based on selected atlas (manifest); error message in the case of species mismatch between subject and atlas. » Atlas viewer also shows the tissue probability maps. » Percent difference between partial-volume corrected and uncorrected result is saved with statistics.
PKIN	<ul style="list-style-type: none"> » Single pixel TACs from data inspector: coordinate added to name; dialog window not closed. » TAC from viewing tool: filter choice for target models extended. » Sigmoid-like parent fraction model added. » Residuals on Plasma panel were incorrect if plasma/whole-blood fraction was used. » Comments facility moved to a main interface tab. » Configuration in the model filter dialog window can be saved as a macro, which can be called in batch or from the taskbar. » Interruption possible for all types of multiple fittings, except for macros.
PXMOD	<ul style="list-style-type: none"> » Parametric mapping of energy loss from 4D Flow velocity field. » Improvements in models with multi-file selection for Interfile, Paravision and Varian formats.

<p>PCARD</p>	<ul style="list-style-type: none"> » Cardiac MR: Motion correction transformation saved in protocol; wall thickening calculation added; acceptance test fix. » Cardiac PET: use of "MBF" and "MFR" according to Consensus paper "Clinical Quantification of Myocardial Blood Flow Using PET". » Cardiac PET: LV object VOI for interactive definition of model size added. » Gated PET: Reversibility values fixed; wall thickening values added.
<p>PFUS</p>	<ul style="list-style-type: none"> » Automatic reslicing when switching using the VOI button instead of going through matching. » "Origin alignment" improved to include rotations for initial transformation of matched data with different orientations. » Cross-correlation quality measure of matching added. Has been used in literature to select the more adequate template (controls vs Alzheimer's). » Color table and species persistence improved.
<p>PGEM</p>	<ul style="list-style-type: none"> » 3D: In-scene colorbar with units; streamlines have arrows showing directions; possibility to add additional images when inspecting results; data profile from cutting with oblique plane. » 4D Flow: user interface revision; adjusted units for helicity and vorticity maps; recalculation without starting from data loading; multi-frame mask; pathlines as alternative to streamlines; NaN handling in streamline tracking; tracking defaults for aorta and brain vessels. » CFD: boundary condition setting improved; velocity boundary from 4D flow image data supported; serialization of case creation parameters.
<p>R Statistics Console</p>	<ul style="list-style-type: none"> » LASSO method implemented as discrimination alternative. » Cumulative sum curve added to histogram and density plot. » Function converting vectors and matrices into aggregates for using predefined scripts. » Rows and columns selection extended by select all. » Improved reporting of text and tables exceeding printout page size. » Script development: pm.copyColumns function added; multiple result sections supported, not only one at the end of script. » Predefined scripts support aggregates with time dimension.
<p>Data Formats</p>	<ul style="list-style-type: none"> » Database import: Improved filling of series description and patient id for non DICOM data. Better handling of formats using two files. » Database: Split series of a patient into new patients with one series each. » DICOM Server: Storage Commitment SOP added. » DICOM: Usage of PET units (activity concentration) when loading image data with multiple units. » DICOM: Dual gated data timing improved. » DICOM: Improvements in reading trigger times with Special Case: "Multivolume MR (sort by trigger times)". » Merging of GE DICOM data produced by dynamic whole body scanning: improved handling of decay correction. » Philips: PAR/REC format updated to handle modified column names (version 4.2). DICOM 4D Flow files can be loaded with Special Case: "Multiframe (Sort by slice position)". » Micropet: support for reconstruction method added.

Zürich, October 28, 2018

Maintenance Builds of Release 3.9

<p>Build 8 Oct 11, 2018</p>	<ul style="list-style-type: none"> ▶▶ VOI: polygon vertexes were shown as circles instead of the customary squares. ▶▶ PCARD: Radial maximum sampling added a zero ring to the polar plot for certain settings of the crop box. ▶▶ Database: Potential database creation problem on MacOS X Mojave fixed which related to missing control of locale information (language, regional settings).
<p>Build 7 Sept 18, 2018</p>	<ul style="list-style-type: none"> ▶▶ PALZ CAVEAT: Since version 3.9 the PALZ results were different from previous versions. This is corrected, restoring the pre-3.9 behavior. <i>PALZ users are strongly advised to install Version 3.9 Build 7!</i> ▶▶ Global "Oncology" flag: Impact including the statistics image overlay is restricted to PVIEW, PFUS, PSEG. ▶▶ PNEURO: Fixed loading of gm/wm/csf map and normalization transformation in Brain Parcellation processing. ▶▶ DICOMDIR creation: more graceful handling in case required elements are missing in the data. ▶▶ SUV_{lbm}: BMI calculation according to Janmahasatian method fixed. ▶▶ Overwriting of non-image files fixed (Linux system bug only). ▶▶ Correction of bug when splitting of dynamic series to individual slices. ▶▶ NaN values handling added for trilinear, cubic spline and sinc interpolation.
<p>Build 6 July 5, 2018</p>	<ul style="list-style-type: none"> ▶▶ Anonymization when exporting data from a database improved: Complete removal of name etc from images and all components (statistics, VOIs, etc). Option to use synthetic name generated from the DB name by encryption algorithm. Option to indicate the name is already anonymized. ▶▶ Privacy disclaimer added to start-up dialog (GDPR). ▶▶ VOI: Statistics selection did not work properly. Statistics measures different from the selected ones could be saved. ▶▶ VOI: Group surface area is also calculated for VOIs with fraction classification. ▶▶ Dynamic VOI: Isocontouring % threshold is calculated individually for each frame. ▶▶ Mouse (Ma-Benveniste-Mirrione) atlas: inferior colliculi corrected. the separation of the inferior colliculi into a left and a right part was faulty. ▶▶ Merging of files: Decay correction corrected to properly handle multiframe DICOM data. ▶▶ LMA GTM partial volume correction: Problem corrected which occurred for small % included pixels (PNEURO, PSEG for segmentations other than Organ separation). ▶▶ PNEURO: When loading old protocols, the new option CSF masking is now enabled. Adjustable border for brain autocropping implemented for improving the reliability of MR/PET matching in batch runs. ▶▶ PCARD: Sector overlays with values added to input data polar maps. Cosmetic change. Compare tab cosmetics related to polar maps. ▶▶ PGEM: Save data profile for oblique cutting planes.

<p>Build 5 April 19, 2018</p>	<ul style="list-style-type: none"> » VOI statistics selection, new default: Only Averaged and SD are initially selected and the configuration dialog is displayed before first run. » VOI statistics of dynamic data: Bug fixed (introduced in Build 4). » Peak VOI for dynamic data: Peak calculation is now correctly done for each frame, and save/retrieve of dynamic peak VOIs was fixed. » Iso-contouring VOI for dynamic data: Restricting VOI was not handled correctly. » Fuselt: Protocol behavior fixed; correctly retrieves data and transformation. » PNEURO: Batch mode could be blocked by a dialog window appearing due to a mapping problem.
<p>Build 4 March 22, 2018</p>	<p>Main innovation: added features for assessing and documenting oncologic lesions. Please refer to the dedicated flyer in the News section on the PMOD website.</p> <ul style="list-style-type: none"> » Global oncology configuration establishes the following defaults: SUV display units, show MIP image in inverted gray, show patient name and ID, use terms "MTV" and "TLG" in statistics. » Hot-key (Ctrl+Q) driven placement of a peak VOI in lesion. » Hot-key (Ctrl+L) generation of an iso-contour VOI of lesion based on % SUVmax, %SUVpeak, or absolute SUV. » Hot-key based assessment of lesions relative to liver: (Ctrl+Shift+U) places 3cm sphere as reference, (Ctrl+U) performs iso-contouring at minimal level of tumor uptake and calculates SUVpeak. » Generation of an iso-contour VOI of lesion based on %SUVmax, % SUVpeak, or absolute SUV. » Configuration of the hot-key VOIs and the overlay statistics in a new panel of the data inspector. » Overlay of relevant VOI statistics (average, peak, max, MTV) in image. » Sorting of VOI list by descending SUVpeak, SUVmax, SUVmean, MTV, diameter. » Statistics units synchronized with display units (SUV type). » Lesion documentation via screen capture (Ctrl+E). <p>Other improvements and changes:</p> <ul style="list-style-type: none"> » Slowness on computer without internet connection due to update and documentation checking: improved, but it is recommended to install the documentation locally and switch off the update checking. » PNEURO: Saving both parametric maps and TACs in batch mode. » PXMED: ssq map added to the SRTM2 model. » PKIN/Parametric mapping: Lack of synchronization between curve and parameter update fixed. » Texture analysis: NaN support, applicable for dynamic series. » PGEM: Export of OpenFOAM's volume mesh to Fluent format. » VOI statistics: Fixed problem in sphericity (was always zero). » Build installation: existing start scripts are not overwritten. » Database: Compatibility with current MySQL established. » R Statistics: Bland-Altman works with NaN. » File saving: Prevent file system write error for file names longer than 255 chars.

<p>Build 3 Jan. 15, 2018</p>	<ul style="list-style-type: none"> » Database of demo data extended by PCARDM and PGEM (CFD) examples. » PXM0D: Two models (Patlak, irreversible 2-compartment model with basis function fitting) added for the parametric mapping of dynamic FDG whole-body data. They account for the slice-wise timing definitions in the image header. » Slice-wise timing for TAC transfer to PKIN: average TAC uses timing of the slice in the VOI center; pixel-wise TAC uses timing of individual slice. » PKIN: Reference curve was not shown when reference region was the first in the list. » Amyloid Cortical Composite atlas added. It contains the definition of the most commonly used composite region for analyzing amyloid data, as well as several reference regions. » Mouse atlas renamed to "Mouse (Ma-Benveniste-Mirrione)" to credit the work of Ma and Benveniste who did the extensive atlas groundwork. » PFUS/PNEURO: Normalization templates derived from ADNI data (FDG, AV45 for AD and controls) added to the list of predefined templates. Brain masking for AV45 templates improved. » Pig Brain Atlas (CH. Malbert) labels fixed: Left/right corrections, Superior_cerebellar_peduncle moved to the non-lateralized Posterior_fossa. » PNEURO: User defined MNI atlases automatically offer the standard normalization templates if MNI is mentioned in the atlas manifest. » PNEURO: Option for enabling/disabling CSF masking and CSF threshold slider added. » PNEURO: Transformation results of a PET/MR workflow are cleared before PET-only protocol execution. » PNEURO: Anatomical reference control added to batch mode panel. » PNEURO/Compare to Norm: Variance pooling estimation corrected. Missing statistics VOIs fixed when repeating analysis with modified parameters. » VOI/RTSS: Fixed problem with conversion to RTSS when contours were defined in different plane orientations. Fixed issue with loading of RTSS data. Fixed problem with wrong series instance UID in RTSS objects created by PMOD. » VOI: Problem of calculating fractal dimension for VOIs defined in X and Y directions fixed. » VOI: Texture analysis can be started from Calculate Statistics menu of VOI Tool. » PCARD: Segmentation parameters for mouse data has been adjusted (active models + valve plane fitting). » PCARD: Manually edited VOIs are now saved correctly to protocols. Protocols for data with changed frame times are now retrieved correctly. » PCARD: Specific protocol retrieval panels for cardiac MR applications. » Pipeline processing: Can be started from command line script and run with or without user interface. Fixed problem with updating the QC tool state. » Interpolation tool: Fixed reading of transformation when deformation field was previously loaded. Fixed saving of resliced image using deformation field transformation. » PGEM: Improved conversion of CFD results to images for comparison with tomographic data.
---	---

	<ul style="list-style-type: none"> » PGEM: Image data can be loaded while visualizing CFD results. » R Console: Aggregate filtering in the presence of NA values fixed; scatter plot fixes. » R Console: Linear Mixed Effect Models is now working with data containing NA values (which are excluded from the analysis). » Network license: More detailed information in license server dialog. If all licenses are occupied there is an information that no license is available and connection can terminate other Pmod instance. » Philips PAR/REC images: Now assumes milliseconds as trigger times units. Improved slice sorting and timing.
<p>Build 2 Nov. 9, 2017</p>	<ul style="list-style-type: none"> » Dynamic Data with slice-dependent timing: Use of the VOI center location timing when transferring VOI TACs to PKIN. Automatic reformatting improved for handling of per-slice information. » VOI: Configuration of the statistics measures of interest introduced for minimizing calculation time. » VOI: Tumor volume segmentation method fixed and improved. Is now working for group of selected VOIs, and a VOI called "Bck" is automatically selected as background VOI. » PXMOD/Resting state model: Fix to avoid masking of correlation matrix. » PXMOD/VOIs tab: fraction mode is new default for interactively outlined VOIs. » PCARDP/Gated: Segmentation method limited to EPI/ENDO Active Model. » PCARDP/Perfusion: Problem in sector TAC calculation fixed. » PCARDM: Segmentation parameters units unified to mm. » PCARD protocols: VOI saving in protocols fixed. » Texture analysis: Information in the tab titles improved. » PGEM: DTI report problem fixed when patient information was missing. » Fusion: Parameters of motion correction transformation can be presented as a graph.
<p>Build 1 Oct. 30, 2017</p>	<p>Initial upload of 3.9 version.</p>

Product Release 3.9

New Features and Revisions

<p>General</p>	<ul style="list-style-type: none"> » Improved handling of the data path history when selecting from the file system rather than the database. » SUV dialog window and inspector revised. Support for SUV_{lbm} by Janmahastian method. Use of UCUM units (e.g. $g/ml\{SUV_{lbm}(Janma)\}$) when saving SUV images to enhanced DICOM objects, otherwise the DICOM SUV Type definition (0054,1006). » Texture analysis within VOIs. » Command line execution of pipeline definitions which include an input file list (e.g. <code>./java/jre/bin/java -Xmx1200M -jar pmod.jar PIPELINE[noGUI] pipe_definition_file.pipeProc</code>). » Pipeline processing: Restriction that a file can only appear once on the input list was removed. » DICOM server starting a pipeline processing with the received data: all non-image data are also saved. » External tool for calculation z-score values relative to the average and the standard deviation within a specified VOI (frame-wise operation for dynamic data). Useful for transforming the data as input to the supervised clustering method). » New option to keep triangulation at the same 3D coordinate when switching between images in a viewport. » Layout panel: "Go to coordinate origin" and "Go to x/y/z coordinate" buttons to support well-defined triangulation. » Extended list of isotopes and radiopharmaceuticals. » Proper units are set for images generated in situations beyond parametric mapping. » Skeletonization added to "Segmentation" external tool. » New automatic VOI generation approach resulting in the hottest connected voxels within a VOI. » External tool for calculation of texture features within VOIs.
<p>PNEURO</p>	<ul style="list-style-type: none"> » Template, Atlas and Parcellation resources converted to compressed images for saving space » White matter parcellation added, resulting in a white matter VOI for each atlas VOI. » Masking of grey matter regions by CSF improved for the maximum probability method. » Revision of the tree organization for better organizing the additional VOIs. » Batch mode improved in several ways: support for mapping added; option to create and save a quality control image showing the generated VOIs on top of the images; new interface item element for specifying the averaging range of dynamic series; saving of TACs, parametric maps, transformations and protocols. » Option to select the dynamic PET instead of the average PET after the VOIs have been outlined. » Support for user-defined atlases in parcellation improved. Supported also in batch mode.

	<ul style="list-style-type: none"> » Warning added when a loaded transformation doesn't match the space of input data.
<p>PKIN</p>	<ul style="list-style-type: none"> » Grid fitting: Start iterative fitting with initial parameter combinations which cover the whole physiologic parameter space. » Monte Carlo: Randomized fitting supported. » Monte Carlo: Noise can be added to tissue TAC instead of model curve. This allows studying situations where the model underlying the data differs from the fitted model. » Monte Carlo: The generated data and the fits can be added to the fitting history for inspection and export. » Monte Carlo: Noise generation using bootstrap method. » Parameter explorer: The listed results correspond either to the current model parameters, or to the latest successful fit. Previously non-fitted regions were omitted. » Fitting history included in parameter explorer to browse histories across regions more easily. » Parameter sensitivity to acquisition duration is now also supported for coupled fits. Creates history entries with the same revision number. » Number of fits required for convergence is also added to the fit details list. » Batch fitting with specified model configuration: Only the tissue model is replaced, the blood configuration now remains unchanged. » Fitting can be stopped after calling "Fit all". » Negative values allowed in blood data. » Blood curve resampling improved. Didn't work properly in all configurations. » "non-blood" model filter introduced which is default until blood data is loaded. » Averaging window introduced in "Plasma Ratio" model for use with bolus/infusion data, where the ratio equals Vt. » Standard error supported in the aggregation of kinetic modeling results. » Support for TACs with different timing across regions. This is particularly relevant for dynamic whole-body and dosimetry studies. » Dosimetry model: Output of cumulated activities for the IDAC2.1 dosimetry program (www.idac-dose.org). » Massive speed improvements for the transfer of pixel-wise TACs.
<p>PXMOD</p>	<ul style="list-style-type: none"> » Revised SRTM2 model, allowing to calculate k2' as the median for the SRTM results in a region and restricted to a physiological range. » Model for DWI MR images. Supports different calculations of the ADC maps including fit of mono exponential. » Model for PCASL MR images which are organized in two dynamic series (control, label), and a proton density image. Supports calculation of average perfusion. » Model for the seed-based correlation analysis of resting state fMRI data. A matrix showing the correlation between the signals of multiple VOIs is shown as image and can be explored with the data inspector probe. » Individual timing is supported for each pixel. This feature is particularly relevant for dynamic data acquired with continuous bed motion.

<p>PCARD</p>	<ul style="list-style-type: none"> » Gated PET: Improved volume and wall-thickening accuracy based on a new interpolated data set (called VOLUME). » Gated PET: More precise valve plane fitting. » Cardiac PET: Acceptance test revised. » Perfusion PET: Transmural gradient for flow areas calculated from the ratio of the endo and epi averages of the relevant segments. » Contours are smoothed. » Optional correction of myocardium TACs for activity remaining from previous scan. » Cardiac MR: Active model segmentation added; can be initialized by markers.
<p>PSEG</p>	<ul style="list-style-type: none"> » Clustering method when using external TACs replaced: the supervised clustering algorithm developed by Turkheimer et al. (2007) for PK11195 is now used instead of k-means. » Brain extraction added to the masking step.
<p>PFUS</p>	<ul style="list-style-type: none"> » Color table lt/ut propagation in absolute values supported.
<p>P3D</p>	<ul style="list-style-type: none"> » Functionality useful for vessel rendering and analysis: Skeletonization of a segment and creation of a vectorized path; creation of planes which can be moved along the path and always are orthogonal to; cutting of object by this plane. » Cutting of SR objects by use of a circle. » Texture display on oblique planes.
<p>PGEM</p>	<ul style="list-style-type: none"> » CFD: Integration with new CFD calculation engine OpenFoam 5.0. » CFD: Use of 4D-Flow derived flow boundary conditions. » CFD: Improvements in case creation GUI, case status detection, case downloading, log display and error detection. » CFD: Cutting interface shows loaded image data. » Added possibility of loading 4D flow data to a scene presenting CFD simulations results. » Added possibility of generating and using skeletons of geometric structures, and cutting those structures by planes perpendicular to the skeletons. » Loaded image data available on 3D page for all processing types. » Heart model updated. » Model with brain regions added.
<p>R Statistics Console</p>	<ul style="list-style-type: none"> » NaN are not removed when statistics are transferred to R Console. » Master table only includes mutual VOIs included in all aggregates » New function "pm.copyColumns()" for copying columns between aggregates. » GUI of Linear Models is not freezing any more during execution. » Improved NA handling when filtering variable is equal NA. » Version control introduced for required packages.

Data Formats	<ul style="list-style-type: none">▶▶ Handling of wrongly formatted injection date in some versions of Albira microPET files.▶▶ Matlab image loader extended to read 4D matrices as dynamic images.▶▶ Improved handling of reversed image indices in the PET DICOM object.▶▶ Fix for handling of DICOMDIR files with icon images.▶▶ Initial reading support for the evolving quantitative PET extension of the BIDS data standard (bids.neuroimaging.io), including encoding of ancillary information in the JSON format.
---------------------	---

Zürich, October 30, 2017

Maintenance Builds of Release 3.8

<p>Build 7 Oct. 2, 2017</p>	<ul style="list-style-type: none"> ▶▶ MacOSX: Improvements for popup panels which were sometimes hidden, depending on system configuration. ▶▶ PXMOD: Fixed problem with using the interactively defined VOI in later stage of the workflow. ▶▶ PBAS: Transfer of TACs to PKIN sets units to kBq/cc when "Global Scale factor to [kBq/cc]" is switched on. ▶▶ PFUS/General: Cubic spline interpolation optimized to avoid long waiting time for dynamic data. ▶▶ PCARD/Gated analysis of small animal data: Volume calculation fixed; segmentation improved; mass calculation fixed. ▶▶ PGEM: Fix related to 4D flow protocol execution; OpenFOAM version number included in acceptance test.
<p>Build 6 July 24, 2017</p>	<ul style="list-style-type: none"> ▶▶ PXMOD/DWI model: zero gradients are now accepted (as opposed to the DTI model). ▶▶ DICOM Server (when started from ToolBox): Pipeline applied to received images now saves also VOIs, statistics and captures. ▶▶ PNEURO: Saving template atlas from outlined VOIs preserves hierarchical structure. ▶▶ PNEURO: Hybrid, matched PET/MR data which was acquired in different orientations don't require the matching step any more. ▶▶ PCARD: MBF polar plots had wrong titles. ▶▶ DICOM: Adjustments to RTSS contour generation for improving MIM compatibility. ▶▶ DICOM: Improvements in reading dynamic MR series (GE private elements; velocity encoding parameter; ASL data sorting). ▶▶ Support for reading gzipped Nifti images. ▶▶ Merging of multiple static series into a single dynamic series: fixed time sorting. ▶▶ R Linear Models and Linear Discrimination: Bug fix related to the "relative to" option. ▶▶ R: Improvements in restricted master table creation including proper handling of the selected part. ▶▶ PGEM: Tracking improvements; CFD case creation streamlined; STL generation fixed. ▶▶ PGEM/4DFlow: Data management improved; protocol support for Philips data; fixes to report.
<p>Build 5 May 15, 2017</p>	<ul style="list-style-type: none"> ▶▶ PNEURO: Ability to save partial-volume corrected images during batch mode and from the "Save all" facility. ▶▶ PXMOD: Edited image acquisition times are now maintained. They were overwritten before because the images were loaded again before calculation. ▶▶ The window/level mode of changing the color table thresholds was improved. ▶▶ Problem fixed in top-hat edge-enhancement procedure. ▶▶ PGEM/4DFlow: Velocity formats with 3 files (e.g. Philips PAR/REC) are now supported by protocol.

<p>Build 4 March 6, 2017</p>	<ul style="list-style-type: none"> » VOI: Erasing was not working properly for VOIs created by "Outline Maps". » PNEURO Batch: Option to save TACs as processing output. » PNEURO Parametric Mapping: Mapping configuration saved in protocol; maps saved in batch mode; maps available in the "Save all" dialog window. » PKIN: Procedure for explicit input curve resampling revised. Instead of using the fraction data timing, the denser whole-blood timing is used. » PKIN: Randomized fitting adds more variation to parameters with very small values. » PCARD: For EPI/ENDO segmentation an approximation of the myocardial mass is included as a result in the MBF workflow. » Image saving: Problem fixed when saving PET images with inconsistent decay correction parameters (times, factors). This information will be omitted. » PGEM: Acceptance test fixed. » PGEM, 4D Flow: Fusion image added as input image on the 3D tab; report improved. » PGEM, DTI: Bug fixed in the report and content improved. » PGEM, CFD: Interface for cutting surface mesh debugged and new feature added (appending cuts). » PGEM: VOIs are verified before adding them to the model (pixel size, origins).
<p>Build 3 Jan. 4, 2017</p>	<ul style="list-style-type: none"> » PNEURO: Batch mode now supports saving a protocol of the processing, as well as saving the transformations. » PKIN: Metabolites data were not saved when a reference tissue model was selected. » PKIN: Inclusion of the standard error in the aggregation. Usable for statistics in the R console. » PKIN: When fitting the parameters of the tissue and the blood models together, the shape parameters of whole blood were not adjusted. » VOI: Converter into DICOM RTSTRUCT improved. » VOI: Plugin added for VOI masking in pipeline. » Manual matching of individual frames of dynamic data improved to retain original orientation. » Aggregation: Improved handling of non-standard units (unit names enclosed in square brackets). » Memory usage of the matrix reduction option during loading improved.
<p>Build 2 Nov. 16, 2016</p>	<ul style="list-style-type: none"> » PKIN: Revised options for saving from the fitting history and the parameter overview. » PCARD: Tracer retention analysis added (called HED in 3.7). Polar plots corrected and VOI selection adjusted for transmural analysis. Retrieval of gated protocols fixed. » PGEM: Fixed problem with handling of the VOI tracking properties in protocol retrieval. Name extension of VOI in 3D scene now corresponds to tracking function. Improvements in the 3D scene control and movie creation. » P3D: 3D protocols with multi planes scene improved. Fixed track coloring in velocity mode with frame selection.

	▶▶ Improved reading of velocity encoding (VENC) from DICOM and Philips PAR/REC.
Build 1 Oct. 27, 2016	Initial upload of 3.8 version.

Product Release 3.8

Considerable effort was spent to optimize PMOD for the ever increasing data sizes, and improvements and extensions were achieved in the various tools.
 New Features and Revisions

<p>General</p>	<ul style="list-style-type: none"> » Support for data sets with very high resolution. Previously there was a limit of about 2^{31} voxels per volume, which prevented the loading of some high-resolved CT series. » User interface scales better for ultra-high display resolution. Larger fonts and scale factor for icon size introduced in the Appearance configuration. » Multiple network licenses can be handled by a single server. » System for tracking the processing progress of a study in the Audit Trail license type. » Administration tool for starting, stopping and monitoring server processes. » Sound can be disabled. » Installers for R added to distribution (Windows, Mac only). » Curve export proposes curve name as file name default. » User-specific default database when using a tailored database set. » Pipeline: Button added to set all intermediate plugin to results save mode. » Segmentation tool extended by histogram display, minimal cluster size, morphological closing and maximal number of clusters. » The patient age is shown in the image info dialog if it is available in the data or can be calculated from the birth and scanning date.
<p>VOI</p>	<ul style="list-style-type: none"> » VOI atlas of the domestic pig brain added (Courtesy: C-H. Malbert). » VOI-based image cropping simplified. » Interpolation between ROIs defined by B-splines on distant slices. » Copy/paste of multiple selected contours. » Change of the plane orientation in which ROIs are defined. » Tool to reduce the density of polygon vertices. » Additional statistics values: NumberOfNaNs - the number of VOI voxels with NaN value; VolumeWithoutNaN - VOI volume minus the volume of NaN voxels. » Morphological VOI tool parameters serialized. » Support for VOI generation from segmentation results. » In pipeline, the VOI Statistics plugin uses all VOIs associated to the image series.
<p>PNEURO</p>	<ul style="list-style-type: none"> » Multi-channel segmentation using two MR images for improving segmentation. » User-defined atlases and the 6 probability maps segmentation can also be used for the parcellation method. » All 6 segments calculated by the 6 probability maps segmentation are now saved. » Muller-Gartner-type partial volume correction variants added, including the region-based voxelwise method (RBV; Thomas et al, EJNMMI 2010).

	<ul style="list-style-type: none"> » Further harmonization of the parcellation and the maximum probability approaches: Brain splitting which is relevant for the left/right separation of white matter and cerebellum can be inspected, recalculated and switched off if it causes problems; when protocols are loaded and use of the saved VOIs enabled, the segmentation step is skipped if the result space corresponds to the VOIs. » Parametric mapping configuration is also stored in the protocol. » Batch mode: Full access to the masking details; brain split control added; new organization of PVC controls; type of protocol indicated. » Improvements related to normal databases: Support for pixel-wise age regression, allowing for the prediction of the image pattern at a certain age; normalization presets for non-human data; reorientation to standard orientation supported.
<p>PKIN</p>	<ul style="list-style-type: none"> » Parametric mapping tool for the analysis of pixel-wise TACs: the TACs of VOI pixels can be transferred to PKIN, analyzed with any model, and parametric maps generated from the results which are in the space of the input image. This tool is suitable for studying tissue heterogeneity, for example in tumors. » Data editor which allows for easily editing loaded data and importing new data via the clipboard. In this way TACs may also be appended to an existing data set. » Visualization of multiple model curves at the same time for comparing the results of different models visually. » Spectral analysis with subtraction of a fixed blood contribution. » Implementation of the SAIF spectral analysis variant (Veronese et al, 2010) which is applicable for irreversible tracers. » Extension of the model with vascular compartment to allow for reversible binding, not just trapping. » Addition of a reference tissue model based on the partial saturation approach for estimation of B_{avail} and $appK_D$ using a single injection protocol with raclopride (Wimberley et al, 2014). » Curve multiplication with exponential. » Bolus/Infusion model returns the percentage of the syringe content to inject as the bolus. » Display of the reference TAC when using reference tissue models. » Facility to plot all regional residuals at once. » Save KM parameters: uses last fit result rather than currently displayed model configuration; standard error added. » Parameter export from fitting history: all fitting results with common revision.
<p>PCARD</p>	<ul style="list-style-type: none"> » Gated PET: Improved segmentation; wall thickening polar plot added. » A new method was introduced for analyzing the transmural perfusion gradient using parametric flow mapping and separation of endo- and epicardial muscle (Sciagrà et al, 2015). » Smoothing parameter added for the MBF parametric map calculation, which has an impact on the transmural analysis. » In Stress/Rest comparison difference and reversibility added. » Dynamic polar plots can be saved as a dynamic image series so that parametric mapping may be applied.

	<ul style="list-style-type: none"> » Several options can be reconfigured when loading protocols (sampling, MBF mapping, transmural analysis). » Masking as part of the cropping procedure was retired.
PXMOD	<ul style="list-style-type: none"> » Model for resting-state fMRI data analysis. It performs the required preprocessing steps like de-trending, filtering, slice timing correction, motion correction, and calculates the correlation coefficients. » k_2' map added to SRTM model. » Better masking support: K-means clustering in the 2-tissue compartment ridge regression model uses the mask; thresholding is not considered if an explicit mask is defined. » Implementation of the spectral analysis with iterative filter (SAIF) model which is applicable for irreversible tracers (Veronese et al, 2010). » Check added that the sizes of the image and the mask agree.
P3D	<ul style="list-style-type: none"> » Distance calculation between two markers. » Introduction of oblique planes which can cut 3D objects, optionally with restriction in a circle. Can be applied for multiple cuts. » Reading and visualization of OpenFOAM polyMesh data representing calculation results such as pressure or velocity on a 3D mesh. » Optional inclusion of wire frame for solid objects.
R Statistics Console	<ul style="list-style-type: none"> » Linear discriminant analysis (LDA) added. The functionality covers the determination of the discriminant coefficients from a training set, is validation using a validation set, and the application for classifying an individual case. » Linear Mixed Effects model number of covariates increased; » ANOVA analysis extended to 5 groups. » The scripts using a mastertable can generate relative statistics for the analysis, and save the potentially restricted working mastertable in the workspace. » Facility added to remove packages; recommended when installing a new R version. » Several plots were improved regarding output and serialization. » Variable edit supports outlier removal using <, >, =, Range from to, and Automatic Quartiles Detection (Boxplot) method. » Export of tables and simple R variables to csv format for import in Excel, SAS, SPSS. » Vector element names visible as column headers.
Data Formats	<ul style="list-style-type: none"> » TIFF: Extended to support save of multiframe files and monochrome images including support for ModelPixelScaleTag (hex 0x830E) to preserve pixel size. » Previous origin values were used when no origins were specified in the file: BrainVisa ROI, Minc, Analyze avw, Matlab matrixes, Interfile, Hidac PET, Varian, GE Advance, Anatomist, nifti (when qform and sform are not defined). Now the origin is set to zero. » Interfile: Unsigned short value representation added for saving.

PSAMPLE	<ul style="list-style-type: none">▶▶ Branching ratio introduced for conversion of the radioactive counts to activity concentration.▶▶ Event buffer introduced for recording the times of external events in the PSAMPLE file.
----------------	--

Zürich, October 27, 2016

Maintenance Builds of Release 3.7

<p>Build 11 Jan. 2, 2017</p>	<ul style="list-style-type: none"> » PKIN: Metabolites data were not saved when a reference tissue model was selected. » PKIN: When fitting the parameters of the tissue and the blood models together, the shape parameters of whole blood were not adjusted. » VOI: STD and STDV were wrong after recalculations triggered by user input in the statistics user interface.
<p>Build 10 Oct. 14, 2016</p>	<ul style="list-style-type: none"> » MacOSX Sierra caused very slow database access and image loading due to inefficient IPv6 implementation. A workaround was implemented to avoid the issues. » The '-upgrade' switch for updating a database when starting a transaction server was improved. » PKIN: The tracer retention model used wrong plasma integral, because only half of the acquisition duration was integrated. » PKIN: Viewing of .kinpar files improved to handle the case of different models in different regions. » DICOM: Improved reading of several study types (molecubes SPECT, perfusion CT, fMRI, dynamic PET). » DICOM: Fixed problem with adding RTSS objects to Dicomdir. Solves DB export for series with RTSS. » Problem fixed with timing when only a subset of the frames was loaded. » Origins can't change any more when applying operations during loading.
<p>Build 9 August 22, 2016</p>	<ul style="list-style-type: none"> » PNEURO: Optional background VOI added for use in partial-volume correction. » PNEURO: Selection of the model for mapping fixed when retrieving protocol. » PSEG: Bug fixed in the LMA PVC when using the Clustering method. » PKIN: t* in MRTM0 was not correctly handled. » PCARDP: Different internal handling of the interpolation, because the RAM demand was excessive for small animal data. » Database loading: Fixed issues (selected series, timing) when loading from a transaction server with selection.
<p>Build 8 July 23, 2016</p>	<ul style="list-style-type: none"> » Absolute values for MIP projections supported. » Wistar Rat Atlas (Tohoku) added. » PSEG: Cluster analysis extended to use a set of external TACs as clustering centroids. » PSEG: Background removal revised. » PKIN: Display of the weighted residuals changed from r/sd^2 to r/sd. Doesn't have an impact on the calculations. » Fuse It: Modality dependent display configuration added. » Improved loading of multiframe TIFF images. » Installation from command line without GUI: java -jar setup.jar -quiet "D:"

<p>Build 7 April 29, 2016</p>	<ul style="list-style-type: none"> » VOI: Volume of hypoxic voxels added to the statistics measures. » Calculation of TAC timing for scanners with continuous acquisition mode updated. » PCARDP: Polar sampling improved for the case of myocardium definition by endo/epi outlines. » Interpolation tool: Explicit options (other than the default mirroring behavior) to handle extrapolation outside the volume boundaries. » SUV display switch: The SUV conversion was applied even in the case of values already in SUV. » Facility to generate an R server starting script from the Config panel. » R: Assigning condition to a variable by the "Set" function improved.
<p>Build 6 April 7, 2016</p>	<ul style="list-style-type: none"> » PNEURO: Parcellation can be deactivated. » PXMOD: Cardiac perfusion model for ammonia has a new masking option. The hardwired (vLV+vRV)>0.75 criterion is replaced by an explicit threshold. » PCARDP: The MBF parameter image is now also masked when applying Epi/Endo segmentation. » PCARDP: contour detection in the gated images improved. » VOI: Improvement of a slight problem in pixel classification when interactively defined vertices were exactly at voxel corners.
<p>Build 5 March 8, 2016</p>	<ul style="list-style-type: none"> » DB structure adjusted for better support of multiple parallel clients on a single computer (eg. ATL version on a single server). Verification of DB versions added to automatic check. <i>Note: Existing databases may need upgrading via the DATABASES tab on the "Config" tool after installation of Build 5.</i> » New server manager functionality. The manager user interface can be started by adding the "-admin" argument in the RunPmod script. It allows starting/stopping/monitoring the server processes (DICOM, database, license servers), viewing logs and outputs, and freeing ATL licenses. The server manager doesn't consume a license. » There was a problem with WIBU key access when exiting sleep mode. Improved to avoid PMOD shutdown. » Distribution: Java VM updated to 1.8.0_73. » VOI: Interpolation between B-spline ROIs results in B-splines. » VOI: Two options for calculating the Peak VOI results: using the full sphere, or only the intersection of the sphere with the original VOI. » R: Improved handling of NaN values in the basic statistics scripts. » R: Functionality to edit aggregate values and apply arithmetic operations to them added. » R: Extraction of external covariates introduced. » PKIN: User interface for a second input function (metabolites) removed, which was not used. » PKIN: AUC of the "Residence times" model was wrong if integration from time 0 was enabled. Additional slight improvements. » PKIN: Fix for km files created from PCARDP. » PNEURO: "Save all" option extended to include protocol saving. » The same default parameters for tissue probability maps normalization are used in all tools (same as in PNEURO).

	<ul style="list-style-type: none"> » The replace tool now supports NaN as the replacement value. » PCARDP: RV region is now outlined closer to the LV. Cropping avoids truncation of any defined VOI. » PGEM: PICO probabilistic tracking method added. Requires tensor image calculated in PXMOD with LUT option and saved in database or as DICOM. » DICOM: The "Accumulated counts" information is preserved when saving images as DICOM NM objects. » Patient information can be edited when importing DICOM data into a database, and when copying data between databases.
<p>Build 4 Dec. 21, 2015</p>	<ul style="list-style-type: none"> » VOI: The mirror operation can now be combined with cloning of the original VOIs. » VOI: Transformation with the deformation field from the 6 probability maps normalization is now also supported. » VOI: Improvement of RTSS export. Exclusions are handled in a DICOM-compliant by introducing bridges. » PKIN: Residence times model could fail when the exponential integration didn't start from time 0. » PKIN: Vt was added to the 3-Tissue Compartment Model. A model variant with K1/k2 as fit parameter is added. » PXMOD: The LSRTM model returns NaN instead of 0 for outliers. » PCARD: The gated analysis now includes 17-segment results. » Segmentation: Option added to adjust the standard brain mask to the data (using normalization of a brain template to the input image). » Font size extended to 32 for supporting displays with very high resolution. » Configuration: Alphabetical sorting supported for configuration lists, like models.
<p>Build 3 Nov. 20, 2015</p>	<ul style="list-style-type: none"> » VOI: Change of the hypoxia index calculation in fraction mode. Now only pixels with at least 50% VOI inclusion are used. » PNEURO brain norm editor: Automatic cropping added. » PNEURO Batch mode: Hammers 1mm was not supported properly. Warning message added indicating that only the 4 standard atlases are supported. » PXMOD, P3D, PVIEW: Brain extraction now also working on DWI MR data. » PKIN: LSRTM model had not been included in model list. » Gated PET: Automatic valve plane fitting improved. Use of an explicitly defined maximum value in polar plot switched off per default. » Philips par/rec data: Loading improved for 4D flow data. » Transaction server: Loading speed improved for multi-file images. » Transaction server: Issue solved when saving to a 3.7 database from a pre-3.7 installation.
<p>Build 2 Nov. 6, 2015</p>	<ul style="list-style-type: none"> » Transaction server: backward compatibility and stability improved. » PNEURO: Affine initialization for 3 probability maps segmentation by overlap method. » PNEURO: Transfer of multiple parametric maps to Fuse It.

	<ul style="list-style-type: none"> » PXMOD: handling of RGB maps and failures in "Save all". » VOI: Choice for the plane orientation when outlining atlases. » VOI: Fix of the "Group" statistics results in the presence of contour and atlas VOIs. » VOI: Fixes in the calculation of statistics for probabilistic VOIs. » PGEM: Protocols for the tracking applications improved. » PCARDM: Fix in linearity correction and protocol saving/retrieving. » Fusion display: tooltips for the tabs indicating which images are mixed.
<p>Build 1 Oct. 26, 2015</p>	<p>Initial upload of 3.7 version.</p>

Product Release 3.7

Along with many general improvements, the 3.7 product release extends PMOD to new application domains. A new PXMOT model calculates parametric diffusion maps and the diffusion tensors from DWI MR images. Further processing of the tensors and tractography is supported by the PGEM tool. In a similar manner, PGEM is able to calculate and visualize streamlines derived from MR 4D flow images. The cardiac tools are extended by functions for the analysis of gated data, both from humans and animals. Following up on requests from scientists developing new tracers, support for the analysis of dosimetry image data has been added and arranged in a smooth workflow.

Features

<p>General</p>	<ul style="list-style-type: none"> » Thorough use of NaN values ("not a number") to indicate results and pixel values which are not valid (PKIN, PXMOT, PNEURO, Fuse It). Formats supporting float values preserve NaNs. In DICOM objects NaNs are stored as padding values. NaNs are disregarded in statistics. » Merging of static images into a dynamic series now supports decay correction. This convenience allows correcting separately acquired statics as occurs in dosimetry studies to the same time point. » For PET data, the display units can be switched between kBq/cc and SUV. » Support of predefined window settings for the configured color tables. » Revised communication between transaction servers resulting in more reliable and faster connections. » External tool added for reading DWI MRI gradient information. » Curve units handling improved. » Image capture into a DICOM series now possible in all directions, not only z-plane. » Revised handling of the origin when the pixel size is changed: The location can be set to the center, stay at the same anatomical location, or the origin values can be retained. » Simplified addition of an existing database to the list of data sources.
<p>VOI</p>	<ul style="list-style-type: none"> » Automatic PET Tumor volume segmentation method implements which is independent of the signal-to-background ratio. (Jentzen W: JNMT 2015). » The fractal VOI shape dimension can be calculated. » In addition to transferring the VOI average TAC to PKIN, the individual pixel TACs can be transferred. » A timing offset can be added to the TACs from data with multiple table positions, depending on the VOI position in the volume. » Support for probabilistic atlases which specify the VOI probability per pixel instead of a clear delineation. » An option was added to automatically back up VOIs at regular intervals. » Organ lists for dosimetry purposes added with assigned volume and mass. » Basic support of Osirix csv VOIs. The files have to be renamed to *.voi. » Option to triangulate the planes in the VOI center instead of the first slice when double-clicking into the VOI list. » SUV unit is serialized in the statistics viewer. » Histogram display of multiple VOIs improved.

	<ul style="list-style-type: none"> » Histogram of pixel values can be displayed when iso-contouring in a VOI.
PGEM	<p>Complete revision of the tool and extension by new functionality.</p> <ul style="list-style-type: none"> » Loading of diffusion tensor images and fiber tracking with various methods and restrictions. » Loading of MR 4D flow images and calculation of streamlines. » 3D visualization of fiber tracks or streamlines. » Saving of fiber tracks or streamlines as VTK files which can be used for visualization in other programs (e.g. ParaView). » Generation of dynamic PET phantom images based on a VOI atlas and corresponding TACs.
PNEURO	<ul style="list-style-type: none"> » 6-probability maps normalization added (corresponds to the segmentation-based normalization in SPM12). » Volume modulation option added when generating the normalized MR in the atlas space. The results can be used for brain morphometry. » Mapping part extended by adding the VOI & Fusion tab as in PXMOD. » Transfer of dynamic input data and resulting parametric maps to Fuse It for comparison. » Norm editor supports segmentation and volume modulation. » Species support for the Maximum Probability approach. » Parcellation now generates the same cortical areas as Maximum Probability. A different normalization has been used before. » Skull stripping added as a new option for rigid matching. » A warning icon is shown when non-standard definition of the grey/white matter segments are used. » Addition of the DTI model for calculating diffusion maps.
PFUSEIT	<ul style="list-style-type: none"> » 6-probability maps normalization added. Resulting deformation maps can be saved. » Masks supported for probability maps normalizations. » Triple fusion page added. » "Primate" added as an additional species for settings configuration. » External tools enabled for Reference and Input data. » Batch improvements: Saving of job lists; use of pairing to simplify configuration. » Volume modulation (preserve total amount) option introduced for reslicing, in case an elastic transformation is applied. Required for morphometry. » Fusion balance buttons activate the corresponding image tabs. » Scientific capture added. » Support for NaNs in image algebra. » Interpolation settings of reslicing are serialized between sessions. » Landmark setting problem fixed when the image was zoomed.
PKIN	<ul style="list-style-type: none"> » An optional blood volume correction was added to non-compartment models (Logan, Patlak, MA1, MA2, Bolus/Infusion, Plasma Ratio, Tracer Retention). For blood volume fractions >0 the whole blood contribution

	<p>(frame average) is subtracted before the actual analysis. Note that data saved with these modes is not compatible with prior versions.</p> <ul style="list-style-type: none"> » Three irreversible models added. Two of them support the Flux as a fitting parameter, which can be initialized from the Patlak plot. The parameter $\lambda \cdot k_3$ is also calculated. » Revision of the "Residence times" model, supporting standard organ volumes. Function to export the results as an OLINDA/EXM case file. » Introduction of a taskbar containing the most useful fitting options as well as model filter presets. A "?" supports tab-sensitive helps. » When the conversion flag is enabled during model switching, the v_B, t^* and Flux parameters are also copied among the relevant models. » Loaded blood measurements can be replaced by the interpolation function values. A new plasma activity curve can be generated from the resampled input curve. » A deconvolution methodology for dispersed blood data acquired with online sampling systems has been implemented (Munk et al, Med Phys 2008). » It is not any more required that all regional TACs have the same timing. For instance, in dynamic whole-body acquisitions there is a time offset between different parts of the body. » The TACs of individual VOI pixels can directly be transferred to PKIN. Up to 10'000 TACs are supported. » The result of the Runs Test is returned as a p-value rather than a binary. » Monte Carlo simulation support added for non-compartment methods with TAC as target (MLAIR, MRTM, MRTM2, LLSQ) as well as non-TAC targets (Logan, Patlak, Logan Ref, Patlak Ref). For the latter, noise is added to the measured TAC. » Composite file format extended for incorporating demographic information. » Blood data can also be modified using the "Edit data" window. » Direct transfer of kinetic parameter sets (.kinPar) to R without the need of aggregating them first. » Use of parameter names instead of the parameter index in .km files. This means that 3.7 PKIN files are not compatible with older installations. » The initialization, conversion and random fits options are also supported in batch mode. » Better handling of curve units for non-radioactivity data.
<p>PCARD</p>	<ul style="list-style-type: none"> » Workflow for the analysis of gated series added (PET and MR). » CT perfusion workflow added. » Cropping changed from cube to ellipsoid.
<p>P3D</p>	<ul style="list-style-type: none"> » Reduction percentage of the number of surface triangles introduced. Speed can be improved and the object size decreased without notable surface degradation. » Visualization of tracks such as DTI fiber tracks and 4D Flow streamlines. » Visualization of vector fields such as the deformable matching deformation field. » Morphological closing option added to the segmentation process.

<p>R Statistics Console</p>	<ul style="list-style-type: none"> » Better support for covariates in the LME script. » Automatic parsing of VOI name suffixes (<i>_l</i>, <i>_r</i>) and generation of a condition vector Left, Right, Other. » Polar plot visualization added. » Script added for the analysis of MR relaxometry data. » Loading of curves added. » Support for saving of tables as result files and their aggregation. » Report now includes patient information.
<p>PXMOD</p>	<ul style="list-style-type: none"> » A model was added for the analysis of DTI MRI images. It calculates various parametric diffusion maps as well as the diffusion image tensors, which can be used for fiber tracking. To accommodate data from different sources a facility was added for loading gradient information from text files. » Unused tabs are hidden. » Opening of the input data settings window is much faster. » Parallel processing changed so that one processor remains free. » NaNs are returned for masked pixels, when parametric mapping fails, or when the result value is beyond the restriction range.
<p>Data Formats</p>	<ul style="list-style-type: none"> » DICOM: Added support to handle and save padding values (values outside actual imaged area). NOTE: this affects the precision of scaling floating point data to 16-bit short representation and may change region statistics when short data representation is used during processing or as a final result. » DICOM: Support for reading and saving DWI MRI gradient information. » DICOM: Special cases extended by protocol name. » Reader of Philips PAR/REC research file format implemented for 4D flow images. » JPEG: Added support to read image resolution (JFIF APP0 x, y density and units) for defining the image pixel size. » New loader "Generated" which allows creating empty, chessboard and fractal image series. Such synthetic data may be useful for testing.
